**Please find below and/or attached an Office communication concerning this application or proceeding.**

The time period for reply, if any, is set in the attached communication.

### Office Action Summary

**Application No.**

10/757,925

**Applicant(s)**

HANSEN ET AL.

**Examiner**

JESSE R. MOLL

**Art Unit**

2181

**Period for Reply** -- The MAILING DATE of this communication appears on the cover sheet with the correspondence address --

A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) OR THIRTY (30) DAYS, WHICHEVER IS LONGER, FROM THE MAILING DATE OF THIS COMMUNICATION.

- Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication.
- If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication.
- Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133). Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

**Status**

- 1) ☒ Responsive to communication(s) filed on 08 January 2009.
- 2a) ☐ This action is **FINAL**. 2b) ☒ This action is non-final.
- 3) ☐ Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under *Ex parte Quayle*, 1935 C.D. 11, 453 O.G. 213.

**Disposition of Claims**

- 4) ☒ Claim(s) 1-26 and 40-67 is/are pending in the application.
- 4a) Of the above claim(s) \_\_\_\_\_ is/are withdrawn from consideration.
- 5) ☐ Claim(s) \_\_\_\_\_ is/are allowed.
- 6) ☒ Claim(s) 1-26 and 40-67 is/are rejected.
- 7) ☐ Claim(s) \_\_\_\_\_ is/are objected to.
- 8) ☐ Claim(s) \_\_\_\_\_ are subject to restriction and/or election requirement.

**Application Papers**

- 9) ☐ The specification is objected to by the Examiner.
- 10) ☐ The drawing(s) filed on \_\_\_\_\_ is/are: a) ☐ accepted or b) ☐ objected to by the Examiner.
- Applicant may not request that any objection to the drawing(s) be held in abeyance. See 37 CFR 1.85(a).
- Replacement drawing sheet(s) including the correction is required if the drawing(s) is objected to. See 37 CFR 1.121(d).
- 11) ☐ The oath or declaration is objected to by the Examiner. Note the attached Office Action or form PTO-152.

**Priority under 35 U.S.C. § 119**

- 12) ☐ Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f).
- a) ☐ All b) ☐ Some \* c) ☐ None of:
1. ☐ Certified copies of the priority documents have been received.
  2. ☐ Certified copies of the priority documents have been received in Application No. \_\_\_\_\_.
  3. ☐ Copies of the certified copies of the priority documents have been received in this National Stage application from the International Bureau (PCT Rule 17.2(a)).

\* See the attached detailed Office action for a list of the certified copies not received.

**Attachment(s)**

- 1) ☐ Notice of References Cited (PTO-892)
- 2) ☐ Notice of Draftsperson's Patent Drawing Review (PTO-948)
- 3) ☒ Information Disclosure Statement(s) (PTO/SI/08)  
Paper No(s)/Mail Date 9 January 2009
- 4) ☐ Interview Summary (PTO-413)  
Paper No(s)/Mail Date \_\_\_\_\_
- 5) ☐ Notice of Informal Patent Application
- 6) ☐ Other: \_\_\_\_\_

## **DETAILED ACTION**

### ***Continued Examination Under 37 CFR 1.114***

1. A request for continued examination under 37 CFR 1.114, including the fee set forth in 37 CFR 1.17(e), was filed in this application after final rejection. Since this application is eligible for continued examination under 37 CFR 1.114, and the fee set forth in 37 CFR 1.17(e) has been timely paid, the finality of the previous Office action has been withdrawn pursuant to 37 CFR 1.114. Applicant's submission filed on 8 January 2009 has been entered.

### ***Priority***

2. Applicant's claim for the benefit of a prior-filed application under 35 U.S.C. 119(e) or under 35 U.S.C. 120, 121, or 365(c) is acknowledged. Applicant has not complied with one or more conditions for receiving the benefit of an earlier filing date under 35 U.S.C. 120 as follows:

The later-filed application must be an application for a patent for an invention which is also disclosed in the prior application (the parent or original nonprovisional application or provisional application). The disclosure of the invention in the parent application and in the later-filed application must be sufficient to comply with the requirements of the first paragraph of 35 U.S.C. 112. See *Transco Products, Inc. v. Performance Contracting, Inc.*, 38 F.3d 551, 32 USPQ2d 1077 (Fed. Cir. 1994).

The disclosure of the prior-filed application, Application No. 09/169,963, fails to provide adequate support or enablement in the manner provided by the first paragraph of 35 U.S.C. 112 for one or more claims of this application. Referring to the current application's independent claims, Applicant No. 09/169,963 briefly mentions a permute operation (figure 8e and page 23, lines 3-10). The current invention as claimed imposes specific limitations on the operation of this instruction, which are not covered in the prior application. For example, Claim 1 recites the limitation "the data selection operand comprising a plurality of fields each independently selecting one of the plurality of data elements; and for each field of the data selection operand, providing the data element selected by the field". The prior application makes no mention of how the data is selected or that selection fields are used to independently select data elements.

### ***Response to Amendment***

3. The declaration filed on 8 January 2009 under 37 CFR 1.131 has been considered but is ineffective to overcome the Lee reference.
4. The evidence submitted is insufficient to establish a conception of the invention prior to the effective date of the Lee reference. While conception is the mental part of the inventive act, it must be capable of proof, such as by demonstrative evidence or by a complete disclosure to another. Conception is more than a vague idea of how to solve a problem. The requisite means

Art Unit: 2181

themselves and their interaction must also be comprehended. See *Mergenthaler v. Scudder*, 1897 C.D. 724, 81 O.G. 1417 (D.C. Cir. 1897). Although the G.Select.8 instruction is shown to rearrange data based on a 64-bit selector, there is no proof that the rearrangement is done with "a plurality of fields each independently selecting one of the plurality of data elements" as recited in all independent claims.

### ***Claim Objections***

5. Claims 12 and 25 objected to because of the following informalities:

In Claim 12, lines 4-5, "... by the plurality of operands in the fourth register to produce ..." should be replaced with "... by the plurality of floating-point operands in the fourth register to produce ..." Dependent claim 25 has similar issues.

### ***Claim Rejections - 35 USC § 102***

6. The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless –

(b) the invention was patented or described in a printed publication in this or a foreign country or in public use or on sale in this country, more than one year prior to the date of application for patent in the United States.

(e) the invention was described in (1) an application for patent, published under section 122(b), by another filed in the United States before the invention by the applicant for patent or (2) a patent granted on an application for patent by another filed in the United States before

Art Unit: 2181

the invention by the applicant for patent, except that an international application filed under the treaty defined in section 351(a) shall have the effects for purposes of this subsection of an application filed in the United States only if the international application designated the United States and was published under Article 21(2) of such treaty in the English language.

7. Claims 1, 2, 4-8, 11-15, 17-21, 24-26, 40, 41, 43, 46, 50, 54, 55, 57, 60 and 64 are rejected under 35 U.S.C. 102(b) as being anticipated by Blleloch (Vector Models for Data-Parallel Computing).

8. Referring to claim 1, Blleloch discloses, as claimed, a method of processing data in a programmable processor, the method comprising: decoding a single instruction (Inverse-permute; see page 66) for selectively arranging data, specifying a data selection operand (see Vector File address format in Fig. 13) and a first and a second register (First and Second halves of A; see page 66 regarding inverse-permute) each having a register width, the first and second registers providing a plurality of data elements (A0-A7) each having an elemental width smaller than the register width, the data selection operand comprising a plurality of fields (Each element in Index Vector I; see page 66) each selecting one (such as 3, 0, 7, 2 and 6 as shown in the last figure of page 6) of the plurality of data elements (selecting A3, A0, A7, A2 and A6); and for each field of the data selection operand, providing the data element (to the output of the instruction) selected by the field to a predetermined position in a catenated result (the corresponding element in the result). Note claims 13, 14 and 26 recite corresponding limitations as set forth in claim 1. As to Claim 26, Blleloch discloses the first register (First half of register A holding A0-A3) providing a

Art Unit: 2181

plurality of data elements (such as elements 0, 2 and 3 see the last figure on page 66).

9. As to claim 2, Billeloch also discloses: the method of claim 1 wherein each field of the data selection operand provides a sufficient number of bits to specify any one of the plurality of data elements (See page 66; Note that clearly any value in the values vector can be selected). Note Claim 15 recites the corresponding limitations as set forth in claim 2.

10. As to claim 4, Billeloch also discloses: the method of claim 1 wherein the data selection operand is provided by a register specified by the single instruction (The Indices vector; see page 66 regarding "inverse-permute values indices"). Note Claim 17, recites the corresponding limitations as set forth in claim

11. As to claim 5, Billeloch also discloses: the method of claim 4 wherein the data selection operand (The Indices vector; see page 66) has a width equal to the specified register width (See page 66 regarding "The values vector must be equal or longer than the indices vector."). Note Claim 18 recites the corresponding limitations as set forth in claim 5.

12. As to claim 6, Billeloch also discloses: the method of claim 1 wherein the catenated result is provided to a register (Inherently, if a vector instruction is executed, it must be stored. Since a register is merely a storage area in a

processor, the result must be provided to a register). Note Claim 19 recites the corresponding limitations as set forth in claim 6.

13. As to claim 7, Blleloch also discloses: the method of claim 1 wherein the plurality of data elements (A0-A7) has a combined width (Length of all the values) equal to the width of the first register (First half of A) plus the width of the second register (Second Half of A; Note that since the two registers are merely the two halves of A, they must have the same width as A). Note Claim 20 recites the corresponding limitations as set forth in claim 7.

14. As to claim 8, Blleloch also discloses: the method of claim 1 wherein the instruction further specifies a data element width of the plurality of data elements (See page 66 regarding the indices vector being variable length; Note that since the indices vector which is supplied with the instruction has a variable length, that length must be specified by the instruction). Note Claim 21 recites the corresponding limitations as set forth in claim 8.

15. As to claim 11, Blleloch also discloses that for each field of the data selection operand, a relative location of the field within the data selection operand corresponds to a relative location of the predetermined position within the catenated result (See page 66; last figure). Note Claim 24 recites the corresponding limitations as set forth in claim 11.

Art Unit: 2181

16. Referring to claim 12, Blleloch also discloses decoding a second single instruction (ApxB; see page 61; section 4.1.2) specifying a third (A) and a fourth register (B) each containing a plurality of floating-point operands (See page 169; section 11.1.3; second paragraph regarding floating-point numbers); multiplying the plurality of floating point operands in the third register by the plurality of operands in the fourth register to produce a plurality of products (Result of ApxB; see page 61); and providing the plurality of products to partitioned fields of a result register as a catenated result (inherently the result must be stored in a register). Note Claim 25 recites the corresponding limitations as set forth in claim 12.

17. Regarding claim 40, Blleloch discloses a method of processing data in a programmable processor, the method comprising: decoding a single instruction (Inverse Permute instruction, see page 66) specifying a plurality of registers (First and Second half of A; see page 66) each having a register width (Inherently, registers must have a width), the plurality of registers storing a plurality of data elements (Segments of Data vector storing A0-A7) each having an elemental width smaller than the register width (Inherently a subsections of the entire vector register must be smaller than the whole), an index register storing an index vector (Index Vector I; see page 66) comprising a plurality of indices stored in partitioned fields of the index register (each selector in the index vector) and a destination register (Inverse-Permute(A,I); see page 66; Note that the operation must have a destination); wherein each index in the index vector comprises a

Art Unit: 2181

sufficient number of bits to represent a range of possible index values (See page 66; Note that clearly any value in the values vector can be selected), the range of possible index values including a different index value for each of the plurality of data elements stored in the plurality of registers, allowing the index to select any data element from the plurality of data elements stored in the plurality of registers (0-7; See page 66 regarding Inverse-permute instruction); wherein each index in the index vector independently selects one of the data elements from the plurality of data elements stored in the plurality of registers (See last paragraph of page 66); and for each index in the index vector, providing a data element selected by the index to a predetermined position (Each position in the result corresponding to the index, see page 66) in the destination register. Note Claims 50, 54 and 64 recite the corresponding limitations as set forth in claim 40.

18. Regarding claim 41, Blleloch also discloses the plurality of registers comprises two registers (First and Second halves of A; additionally, any plurality of registers will inherently comprise two registers since it is a plurality). Note Claim 55 recites the corresponding limitations as set forth in claim 41.

19. Regarding claim 43, Blleloch also discloses the number of selectors stored in the index register is equal to the number of predetermined positions in the destination register (see last figure of page 66). Note Claim 57 recites the corresponding limitations as set forth in claim 43.

Art Unit: 2181

20. Regarding claim 46, Belloch also discloses the index stored in a lowest order set of bits of the index register provides a data element to a lowest order set of bits of the destination register, the index in a second lowest order set of bits of the index register provide a data element to a second lowest order set of bits of the destination register and the index stored in a highest order set of bits of the index register provides a data element to a highest order set of bits of the destination register (see last figure in page 66; as shown, the nth element in the index corresponds to the nth element in the destination). Note Claim 60 recites the corresponding limitations as set forth in claim 46.

21. Claims 1, 11, 14 and 24 are rejected under 35 U.S.C. 102(e) as being anticipated by Lee (U.S. Patent No. 6,381,690).

22. Referring to claim 1 and 14, Lee discloses, as claimed, a method of processing data in a programmable processor the method comprising: decoding a single instruction (performed in figure 1) for selectively arranging data, specifying a data selection operand (Order word 26; see figure 1) and a first and a second register (Items 1-2 and Items 3-4; see figure 1) each having a register width (inherently, registers have a width), the first and second registers providing a plurality of data elements (Items 1-4) each having an elemental width smaller than the register width (inherently, parts are smaller than the whole), the data

Art Unit: 2181

selection operand comprising a plurality of fields (see figure 1 regarding the 4 sections of Order Word) each selecting one (using multiplexers 41-44; see figure 2) of the plurality of data elements; and for each field of the data selection operand (O1-O4; see figure 2), providing the data element selected by the field to a predetermined position in a catenated result (O1 selects T1, O2 selects T2,, etc...; see figure 2)

23. Referring to claims 11 and 24, Lee also discloses that for each field of the data selection operand, a relative location of the field within the data selection operand corresponds to a relative location of the predetermined position within the catenated result (O1 selects T1, O2 selects T2,, etc...; see figure 2).

### ***Claim Rejections - 35 USC § 103***

24. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

Claims 12 and 25 are rejected under 35 U.S.C. 103(a) as being unpatentable over Lee in view of Matsuura (US Patent No. 4,725,973) herein referred to as Matsuura.

Referring to claims 12 and 25, Lee does not expressly disclose decoding a second single instruction specifying a third and a fourth register each containing a plurality of floating-point operands; multiplying the plurality of floating point operands in the third register by the plurality of operands in the fourth register to produce a plurality of products; and providing the plurality of products to partitioned fields of a result register as a catenated result.

Matsuura teaches decoding a second single instruction (Vector Multiply) specifying a third (VR 1) and a fourth register (VR 1); multiplying the plurality of floating point operands in the third register by the plurality of operands in the fourth register to produce a plurality of products; and providing the plurality of products to partitioned fields of a result register (VR 3) as a catenated result (See col. 2, lines 5-20).

At the time of the invention, it would have been obvious for one of ordinary skill in the art to have modified the invention of Lee by using a Vector multiply instruction, as taught by Matsuura, resulting in predictable results for the purpose of increasing flexibility and performance of SIMD processing.

25. Claims 3, 9, 10, 16, 22, 23, 42, 44, 45, 47-49, 51-53, 56, 58, 59, 61-63 and 65-67 are rejected under 35 U.S.C. 103(a) as being unpatentable over Blelloch (Vector Models for Data-Parallel Computing) in view of In re Rose, 105 USPQ 237 (CCPA 1955).

Art Unit: 2181

Blelloch does not expressly disclose the data elements and the predetermined positions are 8-bit (Claims 42, 9, 22, 50 and 64), the selectors are equal-sized (Claims 45, 50, 59 and 64) 4-bit (n) elements (Claims 3, 16, 48, 49, 53, 62, 63 and 67), the first and second registers are 64-bit registers (Claims 42, 51, 56 and 65), the index register is 64-bit (Claims 44, 51, 58 and 65) the destination register is 128-bit (Claims 10, 23, 47, 52, 61 and 66) and there are 16 ( $2^n$ ) data elements (Claims 3, 16, 42, 49, 56 and 63).

In re Rose has shown that changes in size, such as change in the size of the data, is not generally given patentable weight or would have been obvious improvements. Hence, it would have been obvious at the time of the invention for one of ordinary skill in the art to have modified the invention of Blelloch, by making the predetermined positions 8-bit, the selectors equal-sized 4-bit elements, the first and second registers 64-bit registers, the index register 64-bit and the destination register 128-bit, as in re rose has shown to be obvious. Functionally, the size or number of the registers (elements) makes no difference to the overall operation of the system. Simply adding or removing a few addressing bits does not render a computer system novel. In this case, one of ordinary skill in the art would have found it obvious to use 4 bits to address the elements in the vector.

MPEP 2141 reads, in part, as follows:

Art Unit: 2181

The Supreme Court in KSR reaffirmed the familiar framework for determining obviousness as set forth in *Graham v. John Deere Co.* (383 U.S. 1, 148 USPQ 459 (1966)), but stated that the Federal Circuit had erred by applying the teaching- suggestion-motivation (TSM) test in an overly rigid and formalistic way. KSR, 550 U.S. at 82 USPQ2d at 1391. Specifically, the Supreme Court stated that the Federal Circuit had erred in four ways: (1) "by holding that courts and patent examiners should look only to the problem the patentee was trying to solve" (Id. at \_\_ 82 USPQ2d at 1397); (2) by assuming "that a person of ordinary skill attempting to solve a problem will be led only to those elements of prior art designed to solve the same problem" (Id.); (3) by concluding "that a patent claim cannot be proved obvious merely by showing that the combination of elements was obvious to try" (Id.); and (4) by overemphasizing "the risk of courts and patent examiners falling prey to hindsight bias" and as a result applying "[r]igid preventative rules that deny factfinders recourse to common sense" (Id.).

In KSR, the Supreme Court particularly emphasized "the need for caution in granting a patent based on the combination of elements found in the prior art," Id. at \_\_ 82 USPQ2d at 1395, and discussed circumstances in which a patent might be determined to be obvious. Importantly, the Supreme Court reaffirmed principles based on its precedent that "the combination of familiar elements according to known methods is likely to be obvious when it does no more than yield predictable results." Id. at \_\_ 82 USPQ2d at 1395.

The Supreme Court further stated that:

When a work is available in one field of endeavor, design incentives and other market forces can prompt variations of it, either in the same field or a different one. If a person of ordinary skill can implement a predictable variation, § 103 likely bars its patentability. For the same reason, if a technique has been used to improve one device, and a person of ordinary skill in the art would recognize that it would improve similar devices in the same way, using the technique is obvious unless its actual application is beyond his ordinary skill. Id. at \_\_ 82 USPQ2d at 1396. When considering obviousness of a combination of known elements, the operative question is thus "whether the improvement is more than the predictable use of prior art elements according to their established functions." Id. at \_\_ 82 USPQ2d at 1396.

MPEP 2144.04 A reads, in part, as follows:

Art Unit: 2181

In re Rose , 220 F.2d 459, 105 USPQ 237 (CCPA 1955) (Claims directed to a lumber package "of appreciable size and weight requiring handling by a lift truck" where held unpatentable over prior art lumber packages which could be lifted by hand because limitations relating to the size of the package were not sufficient to patentably distinguish over the prior art.); In re Rinehart, 531 F.2d 1048, 189 USPQ 143 (CCPA 1976) ("mere scaling up of a prior art process capable of being scaled up, if such were the case, would not establish patentability in a claim to an old process so scaled." 31 F.2d at 1053, 189 USPQ at 148.).

In Gardner v. TEC Systems, Inc., 725 F.2d 1338, 220 USPQ 777 (Fed. Cir. 1984), cert. denied, 469 U.S. 830, 225 USPQ 232 (1984), the Federal Circuit held that, where the only difference between the prior art and the claims was a recitation of relative dimensions of the claimed device and a device having the claimed relative dimensions would not perform differently than the prior art device, the claimed device was not patentably distinct from the prior art device.

All the elements necessary to produce applicants' invention were known in the art. How one combined such elements to produce applicants' invention was also known in the art. Evidence of this is that applicants' disclosure lacks any detailed description of unique technology necessary to implement applicants' invention. One of ordinary skill would have readily recognized that the results of the combination were predictable. Absent some secondary considerations, not in evidence at this time, applicants invention is obvious over the combination of prior art presented. Increasing the number or size of the registers does not change the processor functionally. Realistically, the number of vector registers would most likely be relatively small. The size of the indexes used for addressing the registers would be  $\log_2 n$  bits wherein  $n$  is the number of addressable registers. Therefore, in order to have a reasonable system a very small number of bits would be used to address registers and one of ordinary skill in the art

Art Unit: 2181

would have found a size of 4 bits (16 elements addressable) to be obvious because there are a limited number of small integers. Additionally, the actual size of registers is normally a power of 2, therefore there are only a few reasonable sizes for registers (1, 2, 4, 8, 16, 32, 64, 128...). All of these values are extremely common in the art and would have been obvious to substitute into Blleloch's system.

### ***Response to Arguments***

26. Applicant's arguments with respect to the Lahti and Cray references have been fully persuasive and are persuasive, the corresponding rejections have been respectfully withdrawn.

27. Applicant's arguments filed 25 January 2007, with respect to the Lee and Blleloch references have been fully considered but they are not persuasive.

28. Regarding the arguments directed to Blleloch, the new grounds of rejection is covered in detail above.

29. Regarding the arguments directed to Lee, as stated above, the evidence presented does not include proof of conception in reference to Applicant's claims.

Art Unit: 2181

Certain aspects of the invention are not shown in the evidence presented. See above for detailed explanation.

30. Regarding the arguments directed to Obviousness in general, Examiner has added much detail in the rationale for his rejection under 35 USC 103 shown above.

### ***Conclusion***

Any inquiry concerning this communication or earlier communications from the examiner should be directed to JESSE R. MOLL whose telephone number is (571)272-2703. The examiner can normally be reached on M-F 10:00 am - 6:30 pm EST. If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Alford Kindred can be reached on (571)272-4037. The fax phone number for the organization where this application or proceeding is assigned is 571-273-8300.

Art Unit: 2181

Information regarding the status of an application may be obtained from the Patent Application Information Retrieval (PAIR) system. Status information for published applications may be obtained from either Private PAIR or Public PAIR. Status information for unpublished applications is available through Private PAIR only. For more information about the PAIR system, see <http://pair-direct.uspto.gov>. Should you have questions on access to the Private PAIR system, contact the Electronic Business Center (EBC) at 866-217-9197 (toll-free). If you would like assistance from a USPTO Customer Service Representative or access to the automated information system, call 800-786-9199 (IN USA OR CANADA) or 571-272-1000.
